Tips for the Winter

- You can easily save energy in the winter by setting the thermostat to 68°F while you're awake and setting it lower while you're asleep or away from home. By turning your thermostat back 10 to 15 degrees for eight hours, you could save five to 15 percent a year on your heating bill.
- Open curtains on your south-facing windows during the day to allow sunlight to naturally heat your home and close them at night to reduce the chill you may feel from cold windows.
- Use a heavy-duty, clear plastic sheet on a frame or tape clear plastic film to the inside of your window frames during the cold winter months. Make sure the plastic is sealed tightly to the frame to help reduce infiltration.
- Install a programmable thermostat; this makes it easy to automatically lower the home temperature at night.
- Check for air leaks around your walls, ceilings, windows, doors, light and plumbing fixtures, switches and electrical outlets.

Tips for the Summer

- In the summer, keep your house warmer than normal when you are away, lowering the thermostat setting only when you are at home and need cooling. Although thermostats can be adjusted manually, programmable thermostats will avoid any discomfort by returning temperatures to normal before you wake or return home.
- When it cools off at night, turn off your cooling system and open your windows while sleeping. When you wake in the morning, shut the windows and blinds to capture the cool air.
- Install window coverings to prevent heat gain through your windows.
- Try running a fan. Keeping the air moving is key to greater comfort in hot weather.

Safety Tips

- Install a carbon monoxide detector in your home. If it is a large home, install one outside each sleeping room.
- Don't use a generator inside of the home.
- Keep your home as dry as possible. Too much water in the home causes mold, structural damage and provides optimal conditions for some pests, especially termites.

General Tips

- Install low-flow shower heads.
- Take short showers instead of baths.
- Lower the thermostat on your water heater to 120 degrees.
- Wash only full loads of dishes and clothes. The average load of laundry uses up to 32 gallons of water. Air dry dishes instead of using your dishwasher's drying cycle.
- Wash your clothes in cold water using cold-water detergents whenever possible.
- Plug home electronics into power strips. Turn the power strips off when the equipment is not in use. TVs and DVD players use several watts of power even in standby mode.
- Use LED light bulbs. An LED light bulb costs as little as \$5 at home improvement stores, and it can save more than \$100 over its lifetime.
- Change air conditioning and furnace filters on a regular basis.
- Check your dryer vent to be sure it is not blocked. This will save energy and may prevent a fire.
- Don't keep your refrigerator or freezer too cold. Recommended temperatures are 35° to 38°F for refrigerators and 0°F for separate freezers for long-term storage.
